

Project Design Phase Solution Architecture

Date	28 June 2026
Team ID	23A51A05M5
Project Name	Employee ID Card Request
Maximum Marks	4 Marks

Solution Architecture:

The Employee ID Card Request System is built on the ServiceNow platform using a layered architecture approach. Employees interact with the system through a Service Catalog item that captures request details such as Employee Name, Department, and Reason for the request. The application logic layer processes the request, routes it for manager approval, and automatically creates tasks for the admin team upon approval.

- **User Interaction Layer:** The Service Catalog provides a self-service interface where employees can submit requests for a new or replacement ID card by providing their details and reason for the request.
- **Business Logic Layer:** Automated workflows and approval processes work together to route the request to the designated manager for approval and trigger notifications once the request is processed.
- **Data & Service Layer:** ServiceNow tables store employee request records and status updates, while notifications and task management capabilities ensure efficient communication and card issuance by the security/admin team.
